# Protein Engineering

- Increase catalytic activity
- Change substrate binding site to increase specificity
- Change the thermal stability
- Increase proteins resistance to proteases
- Change codon composition

# Computational Mutagenesis

**Assumption:** the structural differences between each mutant and the wild-type protein are usually minor and, therefore, their tessellations are similar

**Approach:** a single tessellation of either the wild-type or mutant protein structure can be used to develop environmental descriptors for quantitative evaluation of changes in mutant properties

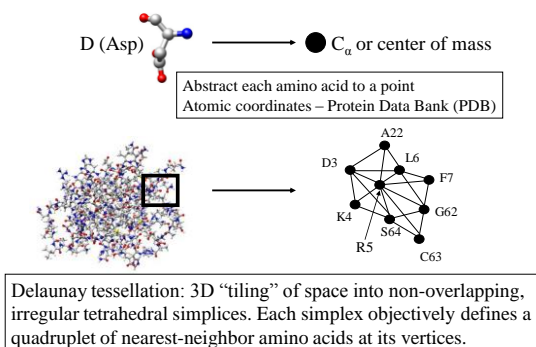

## Residue and mutant score

## Delaunay simplices classification

## Delaunay Tessellation of Protein Structure

## Compositional propensities of Delaunay simplices

- AAAA:  $C = 4! / 4! = 1$
- AAAV:  $C = 4! / (3! \times 1!) = 4$
- AAVV:  $C = 4! / (2! \times 2!) = 6$
- AAVR:  $C = 4! / (2! \times 1! \times 1!) = 12$
- AVRS:  $C = 4! / (1! \times 1! \times 1! \times 1!) = 24$

$$C = \frac{4!}{\prod_i (t_i!)}$$

## Counting Quadruplets

- assuming order independence among residues comprising Delaunay simplices, the maximum number of all possible combinations of quadruplets forming such simplices is 8855

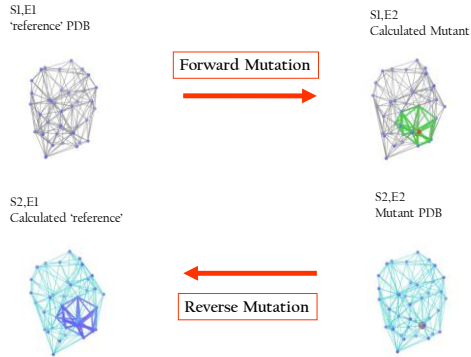

$\underbrace{C \ D \ E \ F}$	$\binom{20}{4}$	4845
$C \ C \ \underbrace{D \ E}$	$20 \cdot \binom{19}{2}$	3420
$\underbrace{C \ C} \ \underbrace{D \ D}$	$\binom{20}{2}$	190
$C \ C \ C \ D$	$20 \cdot 19$	380
$C \ C \ C \ C$	20	20

**8855**
